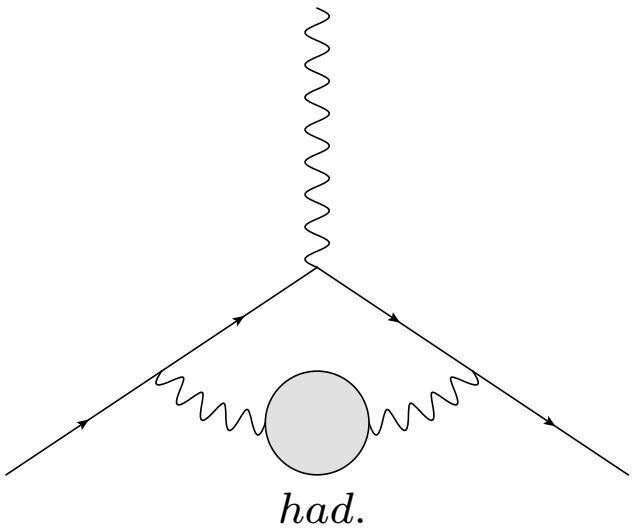
Outline

Overview

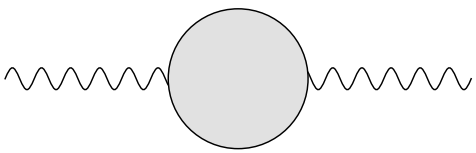
Hadronic vacuum polarisation (HVP)



- problem: QCD is non-perturbative at low energies
- much progress using lattice QCD first-principle calculations
- best current evaluations based on dispersion relations and data (or combinations with lattice)

Hadronic vacuum polarisation (HVP)

Photon HVP function:



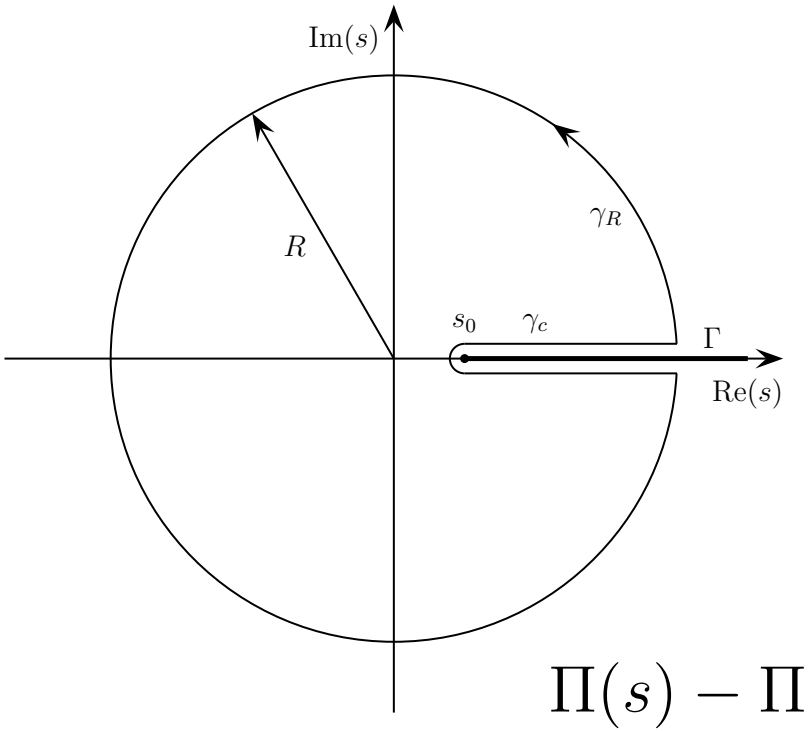
$= i(q^2 g_{\mu\nu} - q_\mu q_\nu)\Pi(q^2)$

Unitarity of the S-matrix implies the optical theorem:

$$\mathrm{Im}\Pi(s) = \frac{s}{e(s)^2}\sigma(e^+e^- \to \mathrm{hadrons})$$

Dispersion relation

Causality implies analyticity:



Cauchy integral formula:

$$\Pi(s) = \frac{1}{2\pi i} \oint_\gamma \frac{\Pi(s')}{s'-s} ds'$$

Deform integration path:

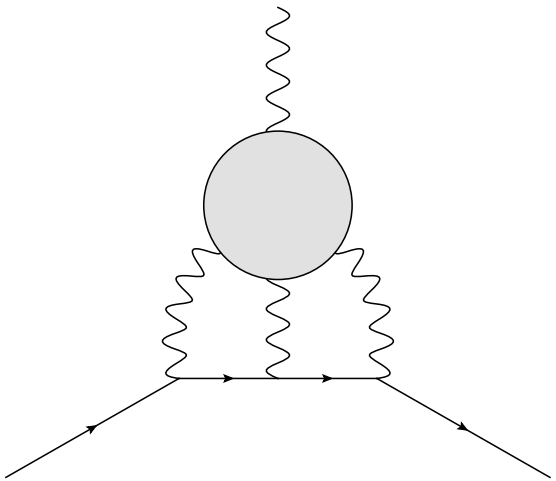
$$\Pi(s) - \Pi(0) = \frac{s}{\pi} \int_{4M_\pi^2}^{\infty} \frac{\mathrm{Im}\Pi(s')}{(s'-s-i\epsilon)s'} ds'$$

HVP contribution to $(g-2)_\mu$

$$a_\mu^{\rm HVP} = \frac{m_\mu^2}{12\pi^3}\int_{s_{\rm thr}}^{\infty} ds\,\frac{\hat{K}(s)}{s}\,\sigma(e^+e^-\to \text{hadrons})$$

- basic principles: unitarity and analyticity
- direct relation to experiment: total hadronic cross section $\sigma(e^+e^-\to \text{hadrons})$
- can be systematically improved: dedicated e^+e^- program (BaBar, Belle, BESIII, CMD3, KLOE2, SND)

Hadronic light-by-light (HLbL) scattering



- so far only model calculations
- uncertainty estimate based rather on consensus than on a systematic method
- with recent progress on vacuum polarisation, HLbL starts to dominate the theory uncertainty
- progress with lattice QCD and dispersive approach

SM contributions to $(g-2)_\mu$

	$10^{11} \times a_\mu$	$10^{11} \times \Delta a_\mu$

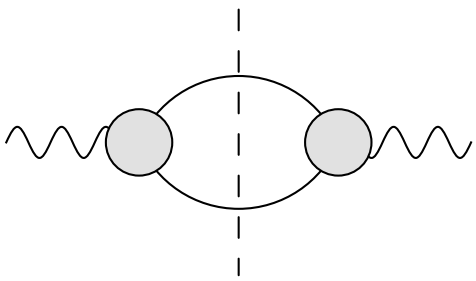
Overview

Two-pion contribution to HVP

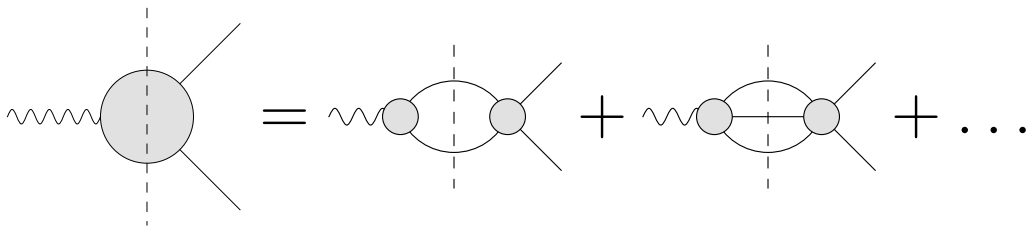
- $\pi\pi$ contribution amounts to more than 70% of HVP contribution
- responsible for a similar fraction of HVP uncertainty
- unitarity relation for $\pi\pi$ contribution to HVP: pion vector form factor (VFF)



$$: \quad \sigma(e^+e^- \to \pi^+\pi^-) \propto |F_\pi^V(s)|^2$$

Two-pion contribution to HVP

- VFF itself fulfils again a unitarity relation:

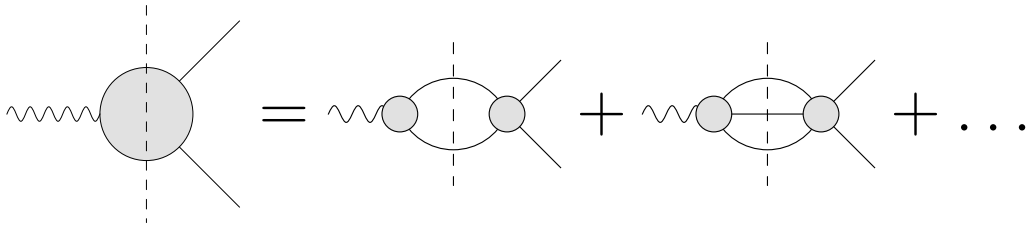


- use the constraints of analyticity and unitarity to better understand uncertainties in HVP $\pi\pi$ channel

  $\rightarrow$ de Trocóniz, Ynduráin, 2001, 2004; Leutwyler, Colangelo 2002, 2003;

  Ananthanarayan et al. 2013, 2016

Dispersive representation of pion VFF

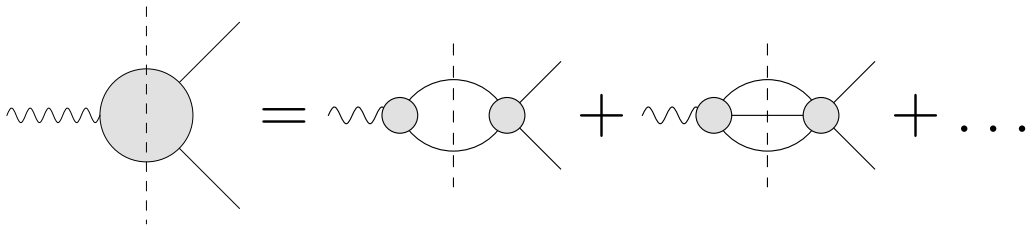


$$F_\pi^V(s) = \Omega_1^1(s) \times G_\omega(s) \times G_{\text{in}}^N(s)$$

- Omnès function with elastic $\pi\pi$-scattering P-wave phase shift $\delta_1^1(s)$ as input:

$$\Omega_1^1(s) = \exp\left\{\frac{s}{\pi}\int_{4M_\pi^2}^{\infty} ds' \frac{\delta_1^1(s')}{s'(s'-s)}\right\}$$

Dispersive representation of pion VFF



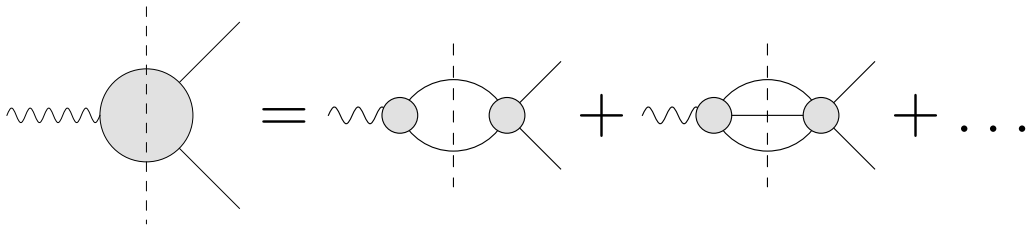
$$F_\pi^V(s) = \Omega_1^1(s) \times G_\omega(s) \times G_{\rm in}^N(s)$$

- isospin-breaking 3π intermediate state: negligible apart from ω resonance ($\rho-\omega$ interference effect)

$$G_\omega(s) = 1 + \frac{s}{\pi}\int_{9M_\pi^2}^{\infty} ds' \frac{{\rm Im} g_\omega(s')}{s'(s'-s)} \left(\frac{1-\frac{9M_\pi^2}{s'}}{1-\frac{9M_\pi^2}{M_\omega^2}}\right)^4,$$

$$g_\omega(s) = 1 + \epsilon_\omega \frac{s}{(M_\omega - \frac{i}{2}\Gamma_\omega)^2 - s}$$

Dispersive representation of pion VFF



$$F_\pi^V(s) = \Omega_1^1(s) \times G_\omega(s) \times G_{\rm in}^N(s)$$

- heavier intermediate states: 4π (mainly $\pi^0\omega$), $\bar{K}K$, ...
- described in terms of a conformal polynomial with cut starting at $\pi^0\omega$ threshold

$$G_{\rm in}^N(s) = 1 + \sum_{k=1}^{N} c_k (z^k(s) - z^k(0))$$

- correct P-wave threshold behaviour imposed

Input and systematic uncertainties

- elastic $\pi\pi$-scattering P-wave phase shift $\delta_1^1(s)$ from Roy-equation analysis, including uncertainties

  $\rightarrow$ Ananthanarayan et al., 2001; Caprini et al., 2012

- high-energy continuation of phase shift above validity of Roy equations
- ω width
- systematics in conformal polynomial: order N, one mapping parameter

Free fit parameters

- value of the elastic $\pi\pi$-scattering P-wave phase shift δ_1^1 at two points (0.8 GeV and 1.15 GeV)
- $\rho - \omega$ mixing parameter ϵ_ω
- ω mass
- energy rescaling for the experimental input, which allows for a calibration uncertainty
- $N - 1$ coefficients in the conformal polynomial

VFF fit to the following data

- time-like cross section data from high-statistics e^+e^- experiments SND, CMD-2, BaBar, KLOE
- space-like VFF data from NA7
- Eidelman – Łukaszuk bound on inelastic phase:

  $\rightarrow$ Eidelman, Łukaszuk, 2004
- iterative fit routine including full experimental covariance matrices and avoiding D'Agostini bias

  $\rightarrow$ D'Agostini, 1994; Ball et al. (NNPDF) 2010

VFF fit results

- perfect fits to all experiments possible (p-value around 3% to 6%) with a few caveats:
  - either M_ω or energy recalibration has to be fit (practically identical results)
  - two outliers in KLOE08 set (> 30 units in χ^2)
  - BESIII covariance matrix cannot be used
- well-known discrepancy between BaBar and KLOE $\Rightarrow$ fit all data sets and inflate errors by $\sqrt{\chi^2/\mathrm{dof}}$
- inelastic effects dominate uncertainty for $(g-2)_\mu$

Contribution to $(g-2)_\mu$

- low-energy $\pi\pi$ contribution:

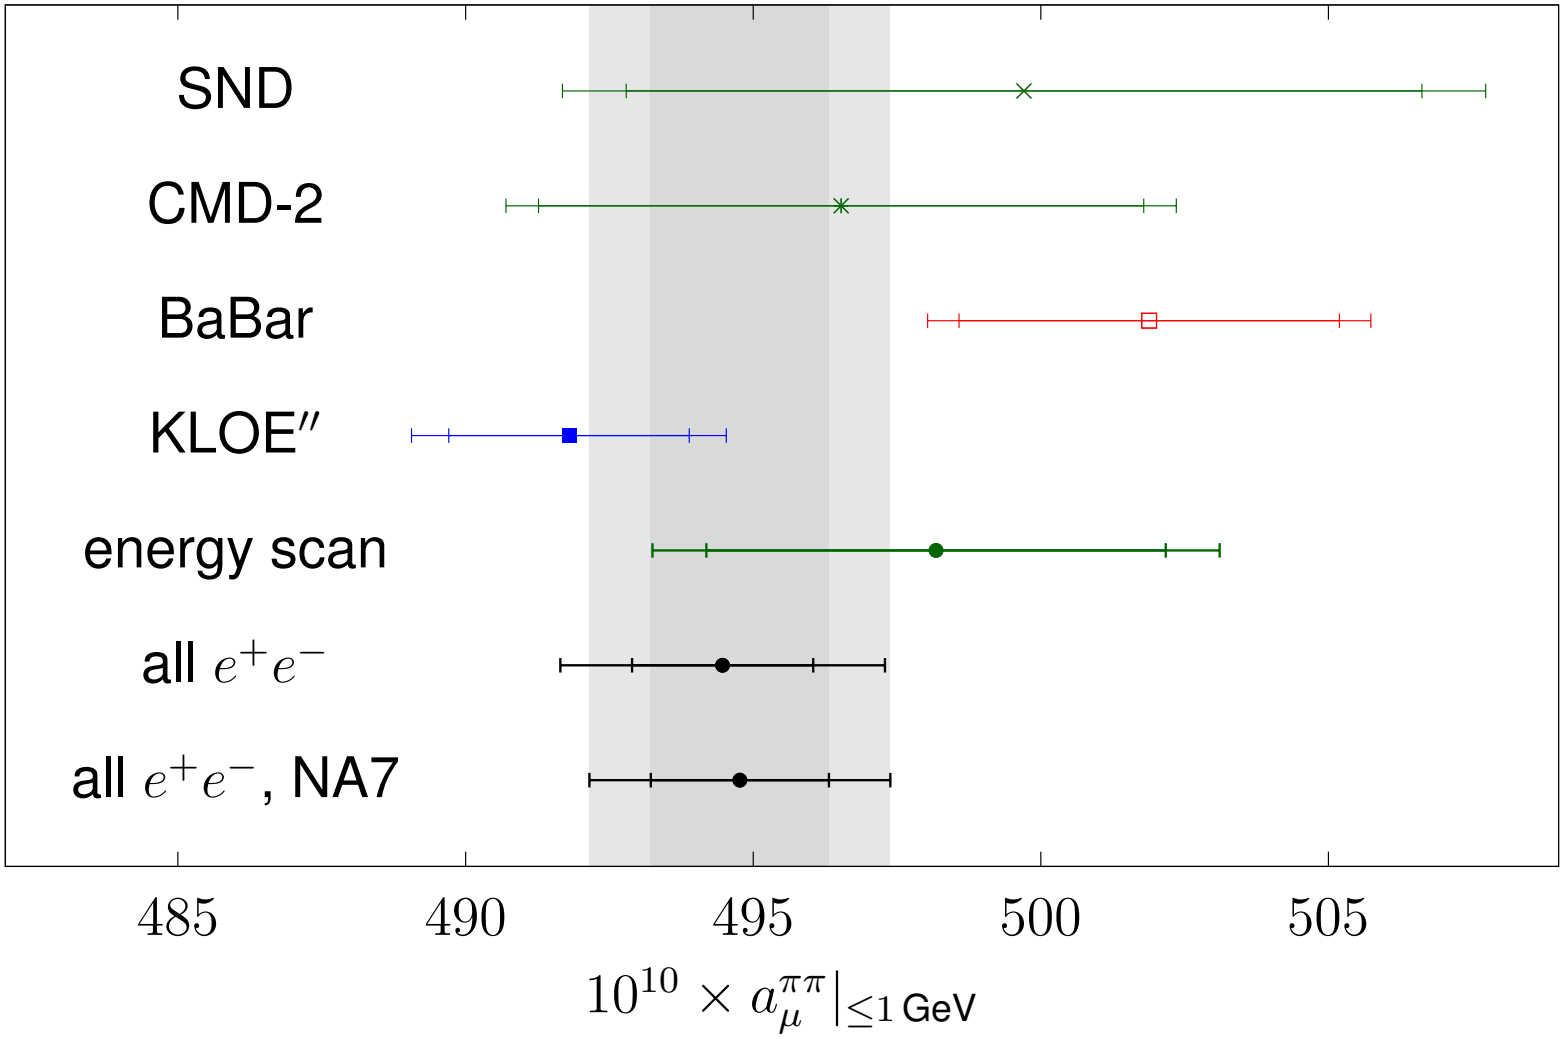
$$a_\mu^{\mathrm{HVP},\pi\pi}|_{\leq 0.63\,\mathrm{GeV}} = 132.8(0.4)(1.1) \times 10^{-10}$$

$\Rightarrow$ compare to $131.1(1.0) \rightarrow$ KNT18, $133.3(7) \rightarrow$ Ananthanarayan et al., 2016

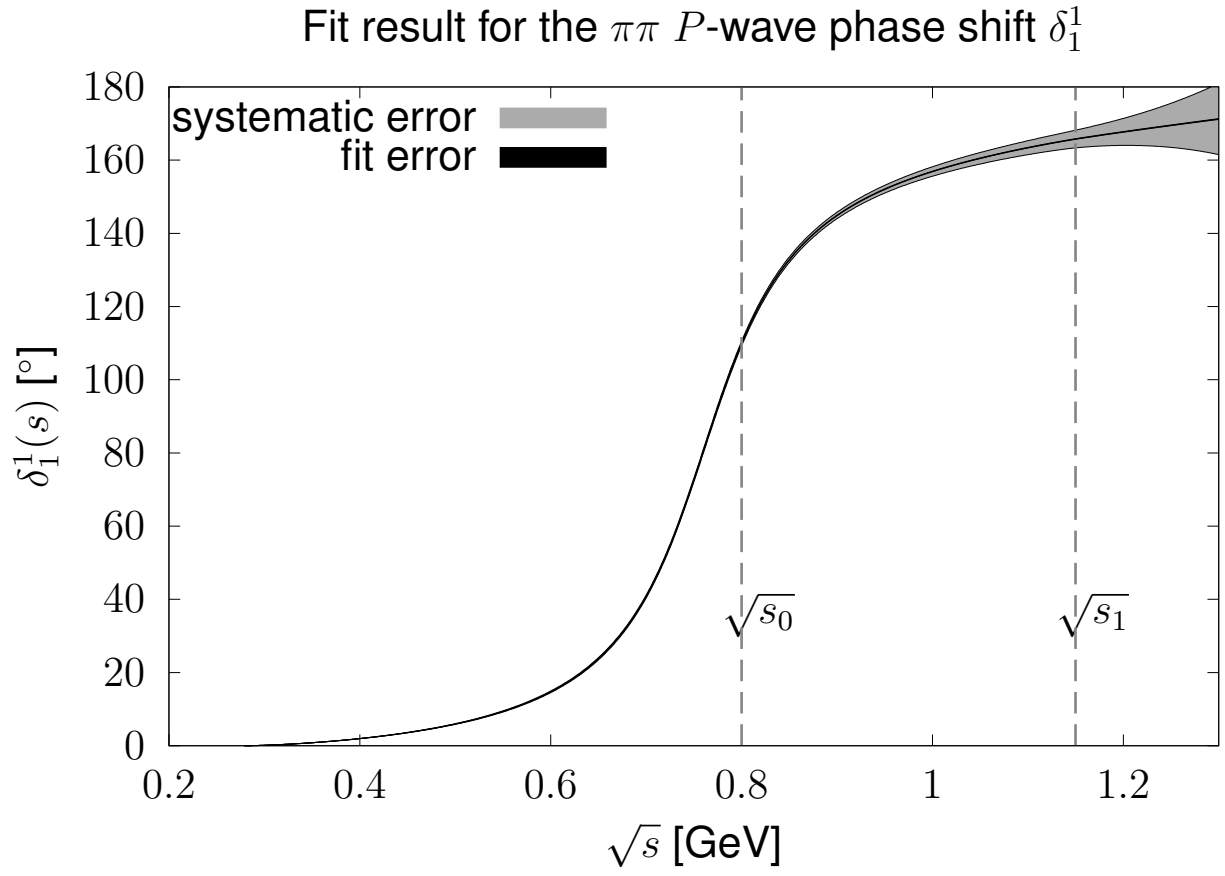
- $\pi\pi$ contribution up to 1 GeV:

$$a_\mu^{\mathrm{HVP},\pi\pi}|_{\leq 1\,\mathrm{GeV}} = 494.8(1.5)(2.1) \times 10^{-10}$$

Result for $a_\mu^{\mathrm{HVP},\pi\pi}$ below 1 GeV



Improved determination of $\delta_1^1(s)$



$$\delta_1^1(s_0) = 110.4(1)(7)^\circ = 110.4(7)^\circ$$

$$\delta_1^1(s_1) = 165.7(0.1)(2.4)^\circ = 165.7(2.4)^\circ$$

Determination of the pion charge radius

definition of charge radius:

$$F_\pi^V(s) = 1 + \frac{1}{6}\langle r_\pi^2\rangle s + \mathcal{O}(s^2)$$

dispersion relation for F_π^V implies sum rule:

$$\langle r_\pi^2\rangle = \frac{6}{\pi}\int_{4M_\pi^2}^{\infty} ds \frac{\mathrm{Im}F_\pi^V(s)}{s^2}$$

our result:

$$\langle r_\pi^2\rangle = 0.429(1)(4)\,\text{fm}^2 = 0.429(4)\,\text{fm}^2$$

compare to PDG: $\langle r_\pi^2\rangle = 0.452(11)\,\text{fm}^2$

(includes potentially model-dependent $eN \to e\pi N$)

A puzzle: ω mass

fit result for ω mass:

combined fit: $M_\omega = 781.69(9)(3)\,\text{MeV}$

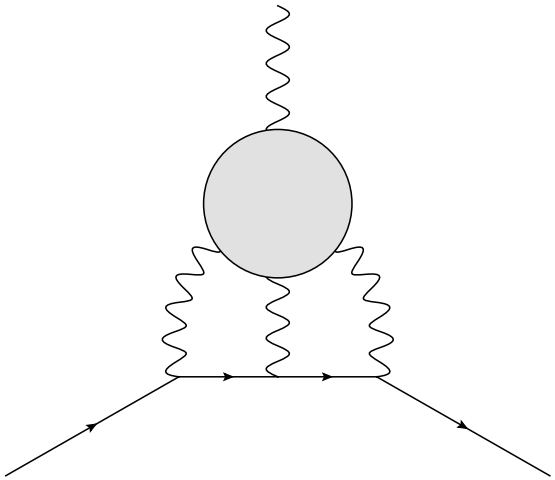
fits to single experiments: $M_\omega = 781.49 \ldots 782.05\,\text{MeV}$

compare to PDG value (dominated by 3π channel):

$$M_\omega^{\text{PDG}} = 782.65(12)\,\text{MeV}$$

Overview

Dispersive approach



- make use of fundamental principles:
  - gauge invariance, crossing symmetry
  - unitarity, analyticity
- relate HLbL to experimentally accessible quantities

BTT Lorentz decomposition

Lorentz decomposition of the HLbL tensor:

→ Bardeen, Tung (1968) and Tarrach (1975)

$$\Pi^{\mu\nu\lambda\sigma}(q_1, q_2, q_3) = \sum_i T_i^{\mu\nu\lambda\sigma} \Pi_i(s, t, u; q_j^2)$$

- Lorentz structures manifestly gauge invariant
- scalar functions Π_i free of kinematic singularities
  $\Rightarrow$ dispersion relation in the Mandelstam variables

Dispersive representation

- write down a double-spectral (Mandelstam) representation for the HLbL tensor
- split the HLbL tensor according to the sum over intermediate (on-shell) states in unitarity relations

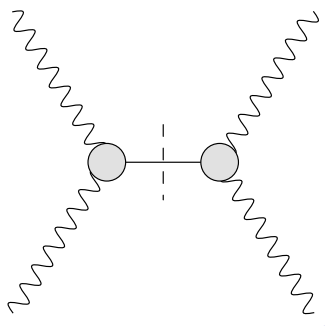
$$\Pi_{\mu\nu\lambda\sigma} = \Pi^{\pi^0\text{-pole}}_{\mu\nu\lambda\sigma} + \Pi^{\text{box}}_{\mu\nu\lambda\sigma} + \Pi^{\pi\pi}_{\mu\nu\lambda\sigma} + \dots$$

Dispersive representation

- write down a double-spectral (Mandelstam) representation for the HLbL tensor
- split the HLbL tensor according to the sum over intermediate (on-shell) states in unitarity relations

$$\Pi_{\mu\nu\lambda\sigma} = \Pi^{\pi^0\text{-pole}}_{\mu\nu\lambda\sigma} + \Pi^{\text{box}}_{\mu\nu\lambda\sigma} + \Pi^{\pi\pi}_{\mu\nu\lambda\sigma} + \dots$$

one-pion intermediate state

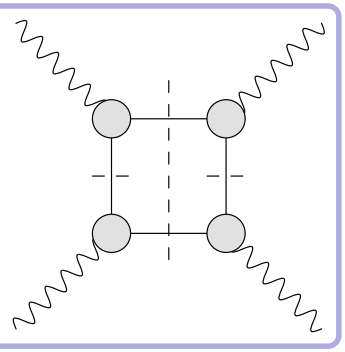


Dispersive representation

- write down a double-spectral (Mandelstam) representation for the HLbL tensor
- split the HLbL tensor according to the sum over intermediate (on-shell) states in unitarity relations

$$\Pi_{\mu\nu\lambda\sigma} = \Pi^{\pi^0\text{-pole}}_{\mu\nu\lambda\sigma} + \Pi^{\text{box}}_{\mu\nu\lambda\sigma} + \Pi^{\pi\pi}_{\mu\nu\lambda\sigma} + \dots$$

two-pion intermediate state in both channels

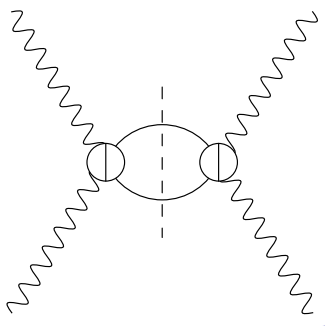


Dispersive representation

- write down a double-spectral (Mandelstam) representation for the HLbL tensor
- split the HLbL tensor according to the sum over intermediate (on-shell) states in unitarity relations

$$\Pi_{\mu\nu\lambda\sigma} = \Pi^{\pi^0\text{-pole}}_{\mu\nu\lambda\sigma} + \Pi^{\text{box}}_{\mu\nu\lambda\sigma} + \Pi^{\pi\pi}_{\mu\nu\lambda\sigma} + \dots$$

two-pion intermediate state in first channel



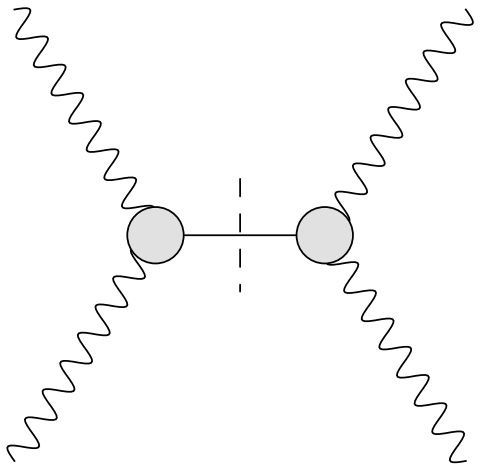
Dispersive representation

- write down a double-spectral (Mandelstam) representation for the HLbL tensor
- split the HLbL tensor according to the sum over intermediate (on-shell) states in unitarity relations

$$\Pi_{\mu\nu\lambda\sigma} = \Pi^{\pi^0\text{-pole}}_{\mu\nu\lambda\sigma} + \Pi^{\text{box}}_{\mu\nu\lambda\sigma} + \Pi^{\pi\pi}_{\mu\nu\lambda\sigma} + \ldots$$

higher intermediate states

Pion pole



$$\bar{\Pi}_1^{\pi^0\text{-pole}} = \frac{\mathcal{F}_{\pi^0\gamma^*\gamma^*}(q_1^2, q_2^2)\mathcal{F}_{\pi^0\gamma^*\gamma}(q_3^2, 0)}{q_3^2 - M_\pi^2}$$

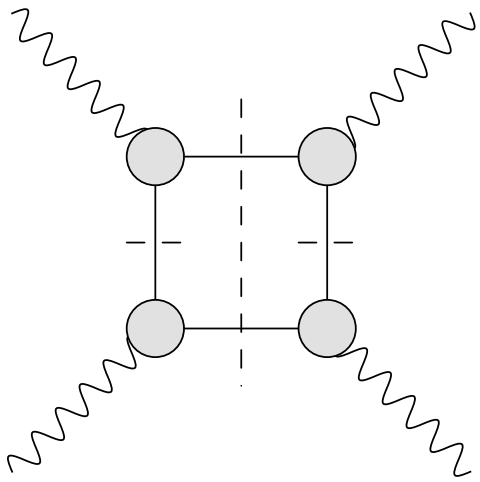
$\bar{\Pi}_2^{\pi^0\text{-pole}}$ via crossing symmetry

- input: doubly-virtual and singly-virtual pion transition form factors $\mathcal{F}_{\gamma^*\gamma^*\pi^0}$ and $\mathcal{F}_{\gamma^*\gamma\pi^0}$
- dispersive analysis of transition form factor:

  $a_\mu^{\pi^0\text{-pole}} = 62.6^{+3.0}_{-2.5} \times 10^{-11}$

  $\rightarrow$ Hoferichter et al., PRL 121 (2018) 112002, JHEP 10 (2018) 141

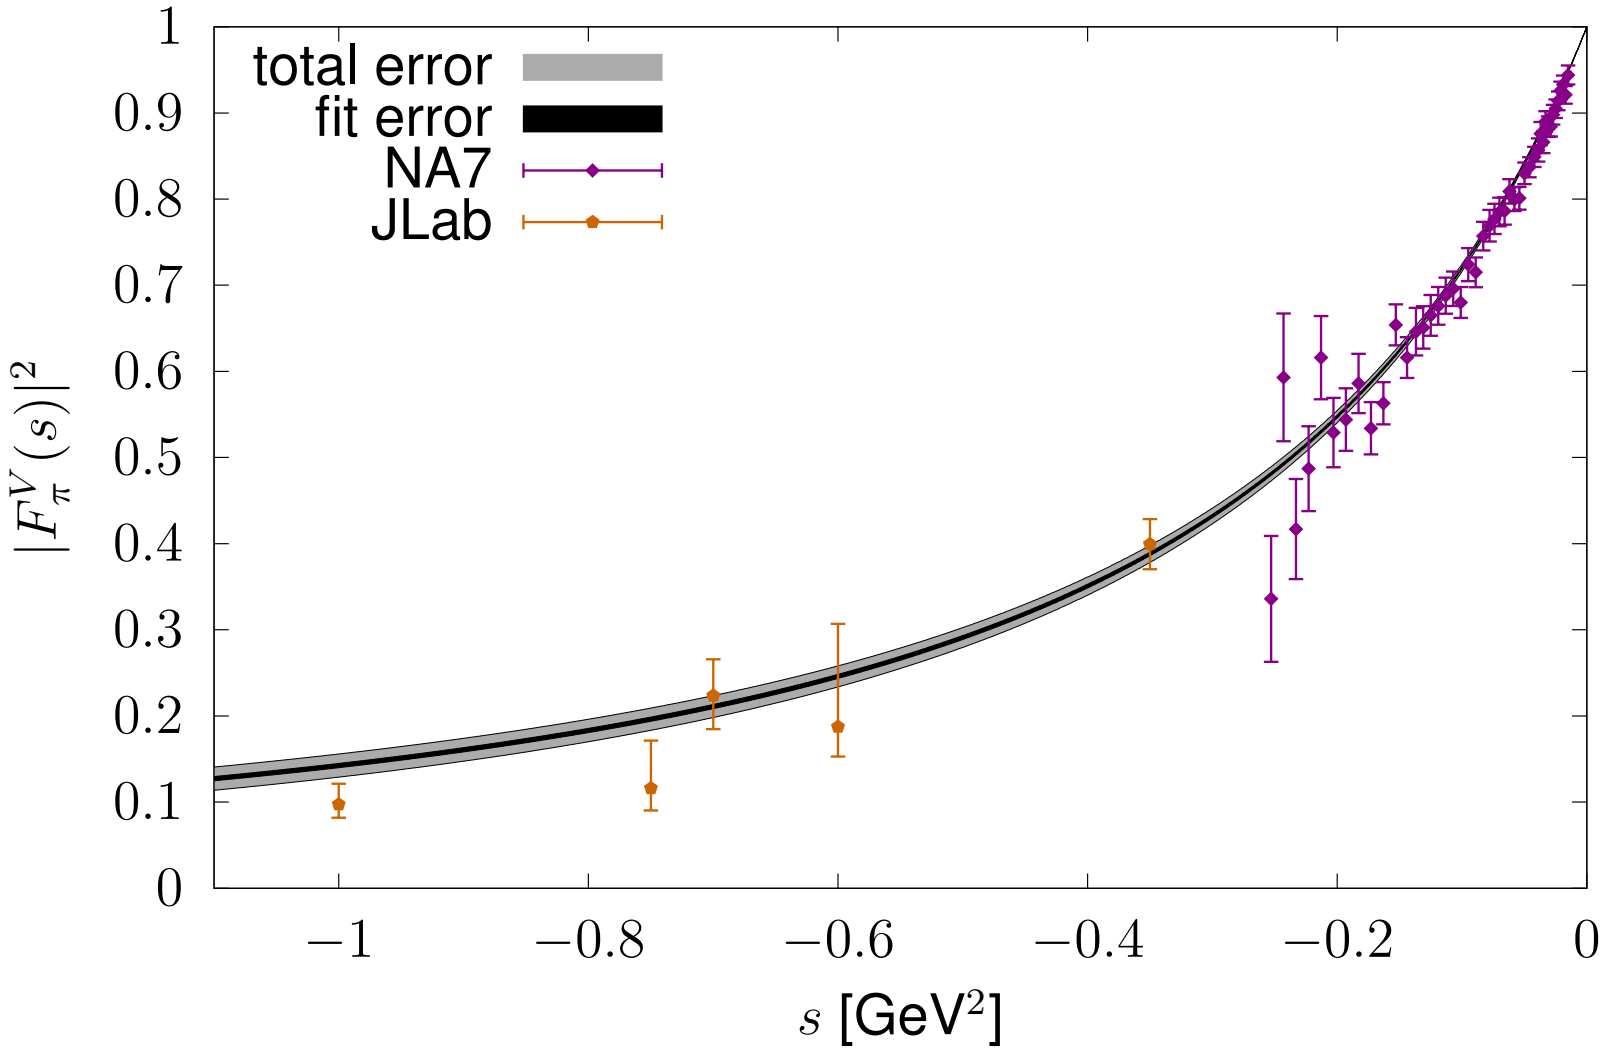
Box contribution



- simultaneous two-pion cuts in two channels
- Mandelstam representation explicitly constructed
- q^2-dependence: pion VFF $F_\pi^V(q_i^2)$ for each off-shell photon factor out

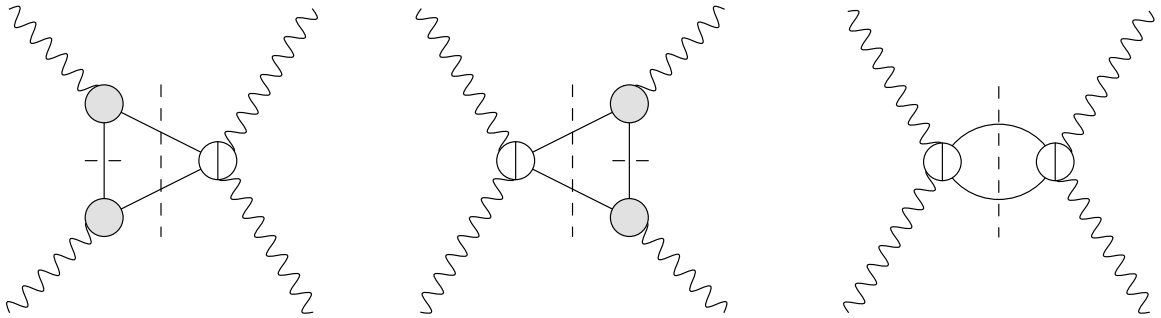
- Wick rotation: integrate over space-like momenta
- dominated by low energies $\leq$ 1 GeV
- result: $a_\mu^{\pi\text{-box}} = -15.9(2) \times 10^{-11}$

Fit result for the VFF $|F_\pi^V(s)|^2$



(the JLab data are not used in the fit)

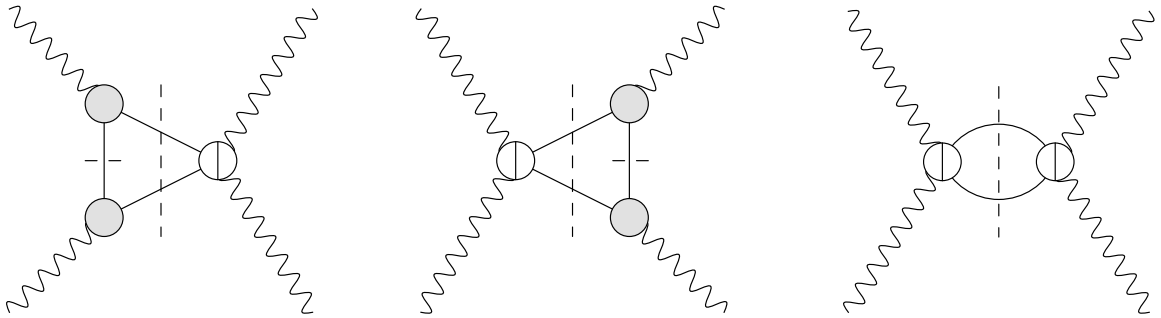
Rescattering contribution



- neglect left-hand cut due to multi-particle intermediate states in crossed channel
- two-pion cut in only one channel:

$$\Pi_i^{\pi\pi} = \frac{1}{2}\left(\frac{1}{\pi}\int_{4M_\pi^2}^{\infty} dt' \frac{\mathrm{Im}\Pi_i^{\pi\pi}(s,t',u')}{t'-t} + \frac{1}{\pi}\int_{4M_\pi^2}^{\infty} du' \frac{\mathrm{Im}\Pi_i^{\pi\pi}(s,t',u')}{u'-u} + \text{fixed-}t + \text{fixed-}u\right)$$

Rescattering contribution



- expansion into partial waves
- unitarity gives imaginary parts in terms of helicity amplitudes for $\gamma^*\gamma^{(*)} \to \pi\pi$:

$$\mathrm{Im}_{\pi\pi} h^J_{\lambda_1\lambda_2,\lambda_3\lambda_4}(s) \propto \sigma_\pi(s) h_{J,\lambda_1\lambda_2}(s) h^*_{J,\lambda_3\lambda_4}(s)$$

- framework valid for arbitrary partial waves
- resummation of PW expansion reproduces full result: checked for pion box

S-wave rescattering contribution

- pion-pole approximation to left-hand cut
  $\Rightarrow q^2$-dependence given by F_π^V
- phase shifts based on modified inverse-amplitude method ($f_0(500)$ parameters accurately reproduced)
- result for S-waves:

$$a_{\mu,J=0}^{\pi\pi,\pi\text{-pole LHC}} = -8(1) \times 10^{-11}$$

Overview

HVP

- precise dispersive determination of pion VFF
- comprehensive analysis of uncertainties in $\pi\pi$ channel
- valuable to corroborate uncertainties of direct integration methods
- precise prediction for low-energy region, but useful up to 1 GeV:

$$a_\mu^{\mathrm{HVP},\pi\pi}|_{\leq 1\,\mathrm{GeV}} = 494.8(1.5)(2.1) \times 10^{-10}$$

- side-products: improved determination of $\pi\pi$ P-wave phase shift; pion charge radius

HLbL

- very precise evaluation of HLbL pion-box contribution:

$$a_\mu^{\pi\text{-box}} = -15.9(2) \times 10^{-11}$$

- precise prediction for S-wave $\pi\pi$-rescattering contribution with pion-pole left-hand cut:

$$a_{\mu,J=0}^{\pi\pi,\pi\text{-pole LHC}} = -8(1) \times 10^{-11}$$

- D-wave contribution work in progress: requires inclusion of higher left-hand cuts
- contributions beyond $\pi\pi$ and pQCD/OPE constraints work in progress

Summary

- our dispersive approach to HVP and HLbL is based on fundamental principles:
  - gauge invariance, crossing symmetry (for HLbL)
  - unitarity, analyticity
- we are focusing on the lightest intermediate states
- relation to experimentally accessible (or again with data dispersively reconstructed) quantities
- precise numerical evaluation of two-pion contributions
- a step towards a model-independent calculation of a_μ
